

What is Nature?

Nature refers to everything in the physical world that is not created by humans. It includes:

- Living things: animals, plants, fungi, microorganisms
- Non-living things: mountains, rivers, oceans, air, rocks, soil, weather, and climate

Main Components of Nature

1. Plants (Flora)

Trees, flowers, grasses, and algae they provide oxygen, food, and shelter.

2. Animals (Fauna)

From tiny insects to large mammals they help maintain balance in ecosystems.

3. Water Bodies

Rivers, lakes, oceans, glaciers vital for life and climate regulation.

4. Landforms

Mountains, valleys, deserts shape the Earth's surface.

5. Air and Climate

Weather patterns and air quality affect all living beings.

Why is Nature Important?

- Oxygen and Food: Plants produce oxygen and food through photosynthesis.
- Ecosystem Services: Nature provides clean air, water, pollination, and fertile soil.

- Mental Health: Being in nature reduces stress and improves mood.
- Biodiversity: A rich variety of life forms supports natural balance and survival.
- Climate Regulation: Forests, oceans, and ice caps help stabilize global temperatures.

Threats to Nature

- Deforestation
- Pollution (air, water, soil)
- Climate Change
- Habitat Loss
- Overuse of Natural Resources

How to Protect Nature

- Recycle and reduce waste
- Use less plastic
- Plant trees
- Save water and energy
- Support eco-friendly products
- Educate others about the importance of nature
